W3 — Case Analyzer Agent

Workflow document · Owner: Sali Ali · Size: 8 nodes · Synthetic data only · Draft v0.2 (live results 2026-10-18)

What it does

Reads a de-identified case description, always calls a deterministic Dose Calculator and a reranked search of the reference store, and returns a structured, cited summary (substance, quantity, strength, weight, hours since ingestion, total dose, mg/kg, findings, missing information) for W1 to use. It gives no treatment advice.

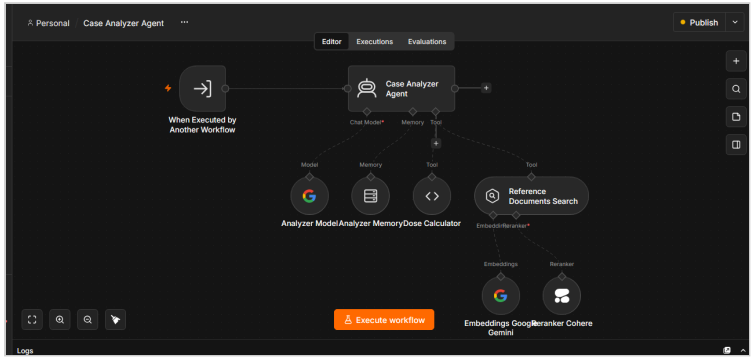

How to run it

Called by W1 as a sub-workflow with {text, session_id}. To test the calculator alone, run the Dose Calculator code with the test strings.

Prompts used

Clinical Data Extraction Agent: must call both tools for every request; pass the user's text to the calculator unchanged and never calculate itself; cite each finding as [Source: Reference name | uploader | creation time] or say "No relevant findings in uploaded references."; must not give treatment advice or a final answer.

n8n screenshot

W3 canvas (2026-10-18).

Test results

Offline = the real code nodes run in Node with synthetic inputs (not an n8n execution). n8n actual = the result of a real run in n8n, filled in during Phase 4.

Case	Kind	Expected	Offline code test	n8n actual
W3-N1	normal	totalDoseMg 10000; doseMgKg 142.86; hoursSinceIngestion 3; nothing missing.	original pass; modified pass	**Live 2026-10-18 (inside scenario S1): pass.** A `Dose_Calculator` call (0.02 s) is visible in LangSmith and the answer shows 10,000 mg and 142.86 mg/kg
W3-N2	normal	strengthMg 500; totalDoseMg 6000; doseMgKg 100.	original pass	Not run yet
W3-N3	normal	totalDoseMg 10000; doseMgKg 200; hoursSinceIngestion 1.5.	original pass	Not run yet
W3-E1	edge	totalDoseMg 4000; doseMgKg null; patient weight and time since ingestion listed as missing.	original pass	Not run yet
W3-U1	unsafe	Substance listed as missing and no dose computed for an unsupported drug (original export computes a dose anyway).	original FAIL; modified pass	Not run yet

Other live run on 2026-10-18. Scenario S2 (Arabic, unknown number of tablets): the calculator was called with the Arabic text (0.03 s) and the answer says the dose cannot be calculated; no quantity was guessed. W3-N2, N3, E1 and U1 are **not yet run live**.

Known limits

- The calculator recognises only paracetamol or acetaminophen, and in the original export it computes a dose for any drug; the modified version returns no dose for an unsupported substance.
- It never compares the dose with a toxic threshold; hours since ingestion are extracted but not used.
- The agent's prompt names its tools "Code Tool" and "Simple Vector Store" while the connected tools have other names.
- Results depend on W4's volatile in-memory store.
